

Route Assistant®

for Direct Store Delivery

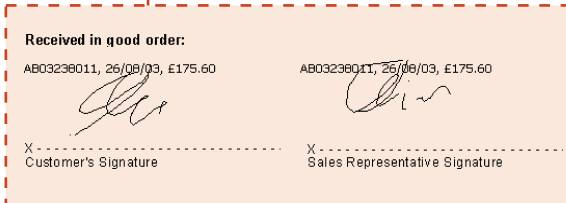

Route Assistant® for Direct Store Delivery is BelTek's advanced solution for direct store delivery (DSD) companies. Based on over thirteen years experience in product development in the DSD sector, the software offers the ultimate in efficient handheld solutions for busy delivery and sales people. Using the familiar Windows® interface means that touchscreens with drop down boxes, look up functions and scroll bars make the system quick to learn and accurate to use. Your drivers will clearly see what is required at each call; where to go, when to arrive, who to see, what products are required, whether returns are permitted, if there are containers to collect – in fact, anything required to service the call as efficiently as possible.

Integration

Route Assistant for Direct Store Delivery will integrate to your back office systems via the Route Administrator® program. Standard integration tools are available for most EDI packages as well as accounts and ERP systems such as ACCPAC, Sage, Microsoft Great Plains, Oracle and SAP.

Signature capture

Route Assistant for Direct Store Delivery captures signatures for electronic Proof of Delivery. Once any changes to the drop are complete the customer (and driver) can sign on screen, the driver prints the Proof of Delivery and the information is sent to the back office system and can be retrieved at the touch of a button.

Record every transaction

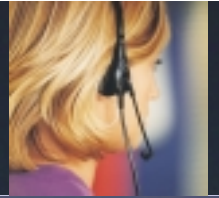

Route Assistant for Direct Store Delivery allows the driver to confirm delivery quantities and make adjustments if necessary; adding items, taking returns and even recording any samples or free items delivered. He can record last minute load adjustments to ensure accurate stock-on-vehicle data. Warehouse transfers, truck transfers and container deposits are all easily recorded. The driver can collect and record payments for COD drops, collect and record cheque payments - and the system even balances his book for him. Imagine the reduction in paperwork for your drivers!

Business benefits

With accurate delivery data available to your back office system the moment the driver returns to the depot, invoices can be generated quickly - improving cash flow. And with ePOD's to support your invoices queries are resolved quickly, avoiding delays in payment. It will no longer be necessary to re-key delivery notes and there is no paper work to be filed. The time, document storage and administrative savings alone ensure the system will pay for itself over and over again.

Route Assistant®

for Direct Store Delivery

Features:

General

Data input via keyboard, touchscreen, barcode, RF
Wireless and/or batch
Electronic messaging
Full audit trail on all transactions
Multiple company invoicing

Start of Day
